MAT 307 : Advanced Multivariable Calculus

Lecture 26

 $\bigcirc$ 

$$r = \beta \sin \varphi$$

$$x = r \cos \theta = \beta \sin \varphi \cos \theta$$

$$y = r \sin \theta = \beta \sin \varphi \sin \theta$$

$$z = \beta \cos \theta$$

$$\frac{Volume \ of \ \alpha \ Bn(1)}{B: \ 0 \le \theta \le 2\pi, \ D \le \theta \le \pi, \ 0 \le e \le R}$$
$$V(B) = \int_{0}^{2\pi} \int_{0}^{\pi} \int_{0}^{R} e^{2} \sin \varphi \ d\varphi \ d\varphi \ d\theta$$
$$= 2\pi \int_{0}^{R} e^{2} d\varphi \ \int_{0}^{\pi} \sin \varphi \ d\varphi$$
$$= \frac{2\pi}{3} R^{3} \cdot (-\cos \varphi) \int_{0}^{\pi}$$
$$= \frac{4\pi}{3} R^{3}$$

 $\sqrt{}$ 

Er: B: 
$$0 \le Q \le \frac{\pi}{2}$$
  $0 \le \Theta \le \frac{\pi}{2}$   
 $P_1 \le P \le P_2$   
between two spheres:  $\frac{1}{8} \circ \frac{P}{8} \frac{Spherical}{She}$   
 $2 \qquad between two spheres:  $\frac{1}{8} \circ \frac{P}{8} \frac{Spherical}{She}$   
 $Q \qquad hersity \quad \delta = reast$   
Mass =  $\int \int \delta dV = \delta \int \int \int \frac{\pi}{2} \int \frac{P}{8} \frac{P$$ 

Y

monuml:  

$$Z = P \cos \varphi$$

$$M_{ry} = \iiint_{r}^{r/2} \int_{r}^{T/2} \int_{r}^{P_{r}} \int_$$

T

Extremos: first shell is the ball:

If  $P_1 = 0$ , then  $\overline{2} = \frac{7}{8}P_2 = \overline{x} = \overline{3}$ 

other extreme:  $P_1 = P_2 - \epsilon$ ,  $\epsilon \ll P_2$ 

$$\overline{z} = \frac{3}{8} \frac{P_{z}^{4} - (P_{z} - \varepsilon)^{4}}{P_{z}^{4} - (P_{z} - \varepsilon)^{5}}$$

But,  $f(x-\varepsilon) \approx f(x) + f'(x)(-\varepsilon)$ 

$$\overline{\mathcal{Z}} \approx \frac{3}{8} \qquad \frac{P_2^{Y} - P_2^{Y} - 4P_2^{3}(-\varepsilon)}{P_2^{3} - P_2^{3} - 3P_2^{2}(-\varepsilon)}$$

$$= \frac{3}{8} \cdot \frac{4P_2^{3}(-\varepsilon)}{3P_2^{2}(-\varepsilon)} = \frac{1}{2}P_2,$$
For the thin shell, center of mass nows unclative to solid '18 of ball.

What is interesting have? If  $\varphi_o = \pi$  (all the ball), then  $I_{2} = \frac{2}{15} \pi S R^{5} (2 + 3 - 1)$  $= \frac{1}{8} \pi S R^{S}$ With this result, we can correct a mistake in the fextbooks of Mechanics. Some such lexts make the following claim: It is hard to measure acceleration of ball in free tay In order to find the law of free fall, we can perform the following exposiment: instead: IF & 1s small, X we can measure its displacement easier and exp. will say it mous with constant acceleration.

In fact, the rolling ball monos with different Acceleration 1 x ( 7 MD x ( f freely rolls consider instead a frictionless place of equal mass sliding down with same acceleration? Do they more down NO. moves down at speed v with angular velocity when ball moves R.W W= p Kinetic energy V  $M = \frac{4}{3}\pi R^3 S$  $= \frac{1}{2} M V^2 + \frac{1}{2} I \omega^2$ translation + votation  $\mathbf{T} = \frac{8}{15} \pi S R^{5}$  $E = \frac{4}{3}\pi R^{3}Sv^{2} + \frac{9}{15}\pi SR^{5}\left(\frac{v^{2}}{R^{2}}\right) = \left(\frac{4}{3} + \frac{3}{15}\right)\pi R^{3}S\frac{v^{2}}{2}$ 

$$E = \begin{pmatrix} 4 + i \\ 3 + i \\ 5 \end{pmatrix} \pi R^{3} \delta \frac{v^{2}}{2}$$

$$E = \frac{4}{3} \pi R^{3} \delta \frac{v^{2}}{2}$$

$$F = \frac{4}{3} \pi R^{3} \delta \frac{v^{2}}{2}$$

$$F = \frac{4}{3} \pi R^{3} \delta \frac{v^{2}}{2}$$

$$F = \frac{4}{3} \pi R^{3} \delta \frac{v^{2}}{2}$$

If you put a ball (or brick) that Slides down, its acceleration is 40% larger that the rolling ball. That is, rolling ball will move obwar slower than the sliding ball.
